Banking on Weed Control

models that incorporate seed-bank dynamics to predict seedling emergence for better weed control.

These banks of weed seeds in the soil are subject to continual "deposits" and "withdrawals." To prevent deposits, farmers can take many simple measures before intervening with herbicides. For example, they can change conditions to keep weeds off balance. Since each weed species is adapted to particular crops and practices, such as tillage methods, farmers can plant a summer annual crop like corn or soybeans, followed by a winter annual crop like wheat, or a perennial crop like alfalfa grown for hay in rotation. This helps ensure that weeds can't find continuous seasons to emerge when they won't face intense competition from crops or be cut for hay. If they do emerge,

Weed management is a lot like health management: You have to choose between a preventive and a reactive approach. Do you wait until you're sick and then go to a doctor for medicine, or do you watch your diet and lifestyle to keep from getting sick in the first place?

A holistic, preventive approach can be applied equally well to weed management and to human health. It focuses on preventive practices and natural processes to regulate weed populations. Emphasis is placed on maximizing beneficial ecological processes within farming systems to maintain weed populations at low, manageable levels. This requires research
