Abstract:

Camp Atterbury and CERL began a collaborative effort to leverage research and installation expertise to address LRAM and Environmental issues beginning in 1999. Camp Atterbury's interest in evaluating new technologies and their proximity to CERL made the installation an ideal site for environmental research and demonstration. As a result, Camp Atterbury has evolved into a primary demonstration facility for CERL's LRAM Team. Opportunities to study erosion control, sedimentation, site hardening, etc. have resulted in the modification of methods, analysis, and products earlier in the development process that will better meet installation requirements. This presentation will discuss current, past and future joint efforts between Camp Atterbury and CERL.
