

# **Evaluation of Dollar Spot Control with the New Biofungicide NovoGuard at Seven University Sites in 2001. (C05-west140937-Poster)**

## **Authors:**

- L. West - *Novozymes Biologicals*

## **Abstract:**

Novozymes new biofungicide NovoGuard was tested at seven university turf centers in the United States during the 2001 field season. Multiple rates and intervals were evaluated and compared to positive and negative controls. Novoguard was more effectively against low and moderate disease pressures though, with proper application rates and intervals, it also provided significant control at high disease pressures. Best rate and interval combinations controlled dollar spot 46-83% compared to standard control (chlorothalonil) range of 58-100%.
